

TINE Video System

**A Modular, Well-Defined, Component-Based
and Interoperable TV System**

Undergoing A Redesign

Stefan Weisse

DESY, Germany

PITZ Overview

Photo Injector Test Facility Zeuthen (2002 on)

- test, condition and optimize sources of high brightness electron beams for future free electron lasers and linear colliders
- goal: intense electron-beam with very small transverse emittance and reasonably small longitudinal emittance
- goal is requirement for FEL operation

“The challenge of PITZ is the production of such beams with very high quality by applying the most advanced techniques in combination with key parameters of projects based on TESLA technology like the FLASH, the European XFEL and the proposed BESSY-FEL.”

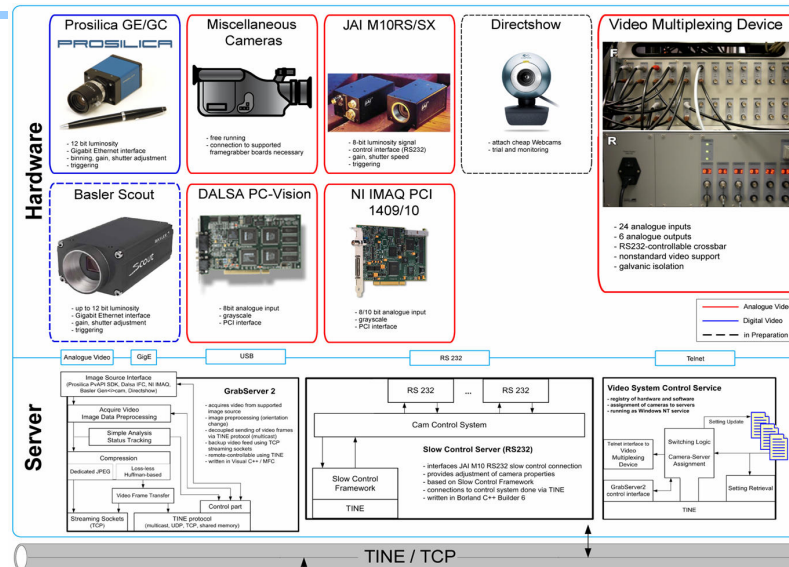

• Field of Activity

- Acquire image sequences from hardware and provide a lossless stream via controls network
- Live view of electron and laser beam position, size and shape
- Support for semiautomatic and automatic measurements
- Remote inspection
- Optimize image quality at image acquisition level

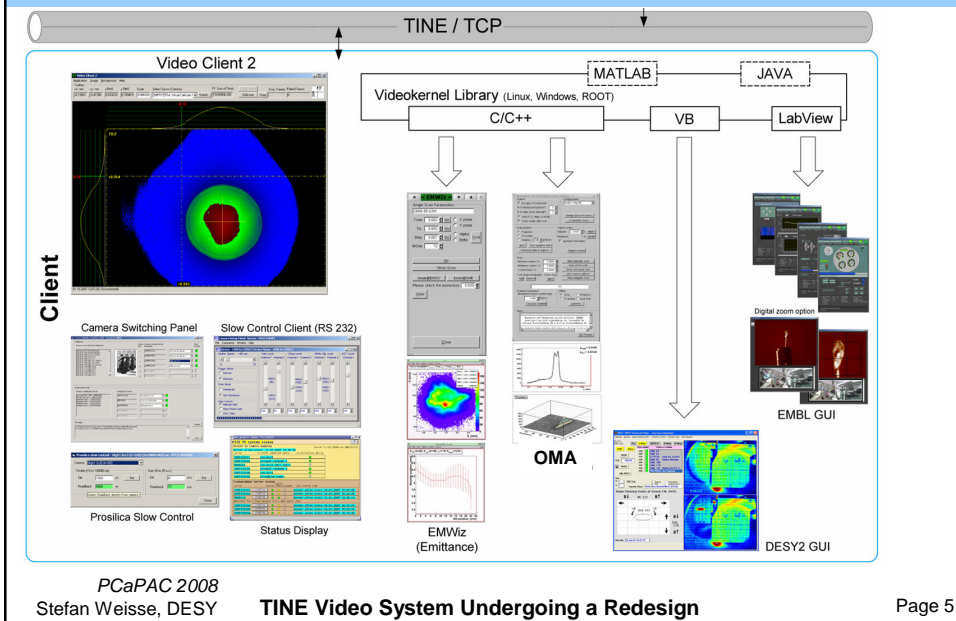

• Challenges

- test facility also test bed: experimental setups, a lot of refactoring
- evaluation of optics, optical readout constructions, new devices
- changes at [goals of] PITZ force changes in TV system and software
- improvements in image readout generate new physics demands (things that were not possible before)
- special, nonstandard usage at PITZ requires rare, custom, unique solutions
- hardware defects because of radiation and tweaked use

Comparing Hardware, Server 2007

Comparing Client side 2007

Why Redesign?

- software was not designed for current tasks and usage
- simplistic, limited way of data transport
- no colour data, no lossy transport
- insufficient space for metadata
- no Java support
- no colour images
- inadequate use of standards for permanent data storage to file(s)
- integration of new imaging hardware more difficult than necessary
- core software tightly bound to Windows API, MFC and Microsoft development environment
- 'reuse of software work'-guideline not followed from the very beginning

Redesign Focus

- easy software reuse
- abstract, modular image acquisition interface
- native Java support for client side
- flexible, open documented transport layer
- component-based design
- use of standard image formats for permanent data storage
- widely usable API

Changes Already Performed Software Reuse

- philosophy of having most sourcecode platform- and compiler independent
 - new software components, parts and algorithms that use C/C++ as language are written in a platform and compiler-independent fashion
 - use ANSI C and ISO C++ where possible
 - platform-specific parts are wrapped, luckily most platforms provide the same functionality, just a little bit different each time (threads, semaphores, sockets, ...)
 - successfully tested at least on Linux 32 and 64 bits gcc and on windows 32 bit msvc6 and msvc8 (visual studio 2005)

Changes Already Performed Video Transport Layer

"How does the video data come from place A to place B?"

- transmission via TINE
- TINE datatype CF_IMAGE (DIMAGE) introduced to TINE API (C and Java)
- special mechanisms in TINE enhance efficiency and response time of 'image sequence' data transfer

Image Bits

Changes Already Performed Java support / TINE Video Bean

- basic Live image consumer
- display enhancement options
- on-screen display
- RGB colour, greyscale, JPEG
- supports old Video System data feeds
- 100% native Java
- performance satisfactory
- integrated in TINE Acop Bean framework

PCaPAC 2008

Page 10

Changes Already Performed Small Grabber Parts

Video System v3 (VSv3) Small Grabber Part (SGP)

SGP: Hardware-independent Image Producer Framework

- acquires images from hardware
- provides control of hardware
- defined interfaces to hardware-dependent part and rest of Video System
- ready: 5+ unique interfaces

PCaPAC 2008
Stefan Weisse, DESY

TINE Video System Undergoing a Redesign

Page 11

Changes in the Queue CoreProvider Component

- past: image acquisition and image preprocessing was done in GrabServer2
- **but** image preprocessing is hardware independent pure software work
- functionality does not need to be implemented in each SGP but extracted and put to CoreProvider

Page 12

Changes in the Queue VideoService Component

- **VideoService: Based on Video and Muxer Service (VIDMUX)**
 - interface between outside (control world) and inside (video system)
 - abstraction level for access from outside world
 - make available, rearrange and lock image sources to providers/consumers
 - central control server
 - repository of cameras, camera ports, servers, settings
- **Renovation**
 - ‘facelift’ dated VIDMUX
 - properly represent new component-based nature
 - improve mechanisms of ‘image source requests’ by clients or components
 - rewrite parts of business logic (historically limited consistency)
 - extend possibilities of repository

Changes in the Queue Standard Image Formats

- **Former Formats**
 - IMM, BKG, IMC, BKC
 - BMP (Windows BMP format)

- **New Formats**

PNG

(grayscale and colour data, lossless, supports lossless compression)

JPEG

(grayscale data as 8 bits per pixel, colour data, lossy, near-lossless possible)

- both support metainformation tags for keeping image metainformation
- both image formats are widely used and supported
- for both formats open-source libraries are available

- refactor library already existing for old Video System to support new transport layer, file formats
- create centralized shared library for C/C++
 - restructure main components, move selected central functionality and algorithms to library
- create API in order to easily interface core system

- Finish Main Changes
 - CoreProvider
 - VideoService
 - standard file formats
 - Migration, extension of interface library, API
- further tests installations at PITZ
- rollout of new core setup at PITZ
- test installations at Petra III, LINAC2, EMBL

- Java support framework?
- Consider advanced installations at Linac2, Petra III, EMBL
- Intermediate components
 - DAQ integration
 - Save MPEG1/2 movies to disk
 - Gain of functionality by parts and clients written by users

Thank you for listening.
